

PROGRAMLOOM PRODUCTION READINESS

Reliable Programs

From proposal to published agenda

Priya Raman - fictional speaker identity

What is blocking readiness?

A program is a chain of durable state transitions, not a spreadsheet.

01

Make work visible

Live counts and owners
replace status meetings.

02

Make state durable

Every decision, delivery,
and change is auditable.

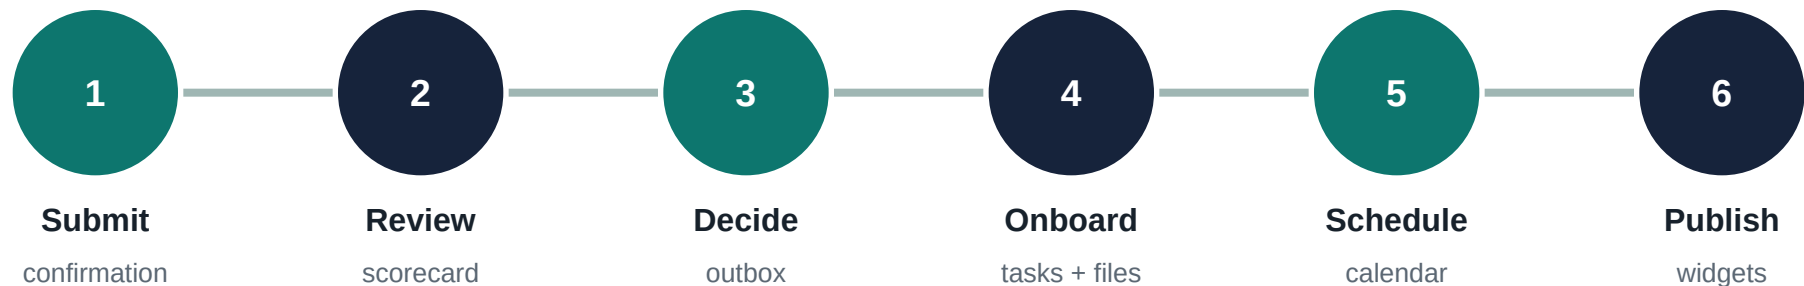

03

Make recovery safe

Retries are idempotent;
failures are actionable.

One proposal, one connected record graph

Each transition creates the next authorized workspace and evidence trail.

Delivery evidence is monotonic

Late provider events must never move a message backward.

Stable idempotency key + provider ID + signed webhook evidence

Retries recover delivery without producing duplicate messages.

THE READINESS LOOP

See it. Own it. Resolve it. Prove it.

A clear control room is the operational definition of ready.
